Mobile HD Voice service using AMR Wideband

Mobile HD Voice based on AMR (Adaptive Multi Rate) Wideband technology (W-AMR) enables high-quality voice calls in mobile networks and an improved user experience. It provides significantly higher voice quality for calls between mobile phones supporting the feature, and can be implemented in GSM, WCDMA (UMTS) and LTE networks. The higher voice quality using HD Voice improves the call experience, allowing people to better share feelings, do business and communicate information. HD Voice transmits a broader spectrum of the human voice; therefore conversation is more natural and is likened to speaking to the other party in the same room. HD Voice also helps people hear better in noisy environments.

HD Voice helps operators to clearly differentiate their offerings and enable high quality services to voice dependent business like call center services, information services, emergency services, etc. HD Voice is also ideal for conference calls and can contribute to a reduction in business travel and raise productivity while reducing the environmental impact. Calls which are easier to hear and understand reduce fatigue typically associated with long conference calls. HD Voice changes that and represents the greatest advance in voice on mobile networks in decades.

W-AMR speech technology is standardized in 3GPP Release 5. The new speech-compression algorithm doubles voice bandwidth (50–7000 Hz) compared to the current narrowband speech codec (300–3400 Hz) without extra radio or transmission requirements. According to 3GPP, 12.65 kbit/s or higher coding bit-rates provide high-quality wideband audio (lower bit-rates of 8.85 and 6.6 kbit/s are for temporary use during adverse radio conditions or periods of cell congestion). In subjective tests the HD Voice wideband codec produces better results than the best narrow-band codec.

There is a strong business case for Mobile HD Voice and the momentum for introducing HD Voice is growing. Customers make more or longer calls with HD Voice. Surveys confirm that customers place a high value on HD Voice.

The maximum benefits from using HD Voice on a compatible mobile network are realized or perceived when both calling and called party use HD Voice-capable phones. Improvements in call quality are also observed even when calling a non-HD Voice phone, due to improvements in the acoustic performance and advanced noise reduction capabilities present in most HD Voice phones.

Commercial HD Voice services launched on 41 mobile networks

The pace of commercialization of mobile HD Voice services is accelerating.

Leading system vendors are supporting HD Voice in their mobile infrastructure solutions.

From first service launch in 2009, HD Voice service is launched on 41 mobile networks in 33 countries: Armenia, Australia, Austria, Belgium, Bulgaria, Canada, Croatia, Czech Republic, Denmark, Dominican Republic, Egypt, France, Germany, Hong Kong, India, Ireland, Italy, Kenya, Luxembourg, Mauritius, Moldova, The Netherlands, Poland, Réunion, Romania, Russia, Serbia, Slovenia, Spain, Switzerland, Turkey, Uganda, UK.

Excellent mobile HD-Voice devices ecosystem established

Dozens of HD-Voice enabled mobile phones have been launched in the market by several leading manufacturers, including products for professional broadcasters. Many phones are now delivered with HD Voice activated as default. More details are provided later in this report.

While initial W-AMR enabled phones were designed to support HD Voice services on WCDMA-HSPA networks, phones are now available which support HD Voice on GSM networks.
Network aspects

Ordinarily the voice payload for transport in the core network is PCM-coded at 64 kbit/s according to ITU-T Rec. G.711. Narrowband AMR is transcoded to/from PCM which degrades voice quality, adding signal processing complexity. Analog PCM-based transport cannot be used with W-AMR as G.711 only applies to narrowband voice. W-AMR must be based on one of two complementary 3GPP standards: tandem-free operation (TFO) or transcoder-free operation (TrFO). Introduction of W-AMR into GSM systems requires TFO, which is part of 3GPP GERAN, which does not require substantial modification of the core network. W-AMR and TFO can also be introduced into UMTS. A better option however, is to use the recommended TrFO. The combination of TFO and TrFO enables W-AMR calls between all types of 3GPP mobile devices (i.e. GSM/EDGE and UMTS/WCDMA-HSPA).

HD Voice ecosystem: wide choice of compatible phones

Dozens of HD-Voice enabled mobile phones have been launched by many leading manufacturers including products for professional broadcasters. An increasing number of phones are now delivered with HD Voice activated as default. Demand has increased and generally operators typically want to maximize HD voice handset availability in all channels. All Xperias phones are shipping with HD Voice turned on for 3G/WCDMA-HSPA operation. Nokia’s Symbian Belle release brings HD Voice for GSM operators, enabled by Nokia 600, 700, and 701 phones, with HD Voice (W-AMR) turned on as default for WCDMA and GSM modes. Symbian Belle will also be available as a software update for current models in the market - Nokia N8, E6, E7, C6-01, C7 and X7, giving owners the option to upgrade shortly. Nokia Lumia products have HD support for both GSM and WCDMA. Nokia also has more affordable HD Voice products e.g. Nokia X3 and 3. Operators with commercially launched mobile HD Voice services often list compatible phones for their respective networks. Some recent examples are given below referencing details provided by operators on their websites. Note: certain products may be carrier specific and may not be compatible for all networks or all markets. This information is therefore provided for interest and guidance only:

Table 1: 41 mobile HD Voice commercial launches (copyright GSA – May 21, 2012)

According to the results of an operator survey:
- 96% of customers are satisfied with HD Voice calls
- 86% of testers say that compatibility with HD voice would be a selection criterion when purchasing a mobile in the future
- 76% of testers would be prepared to change mobiles to obtain HD Voice

Verizon Wireless demonstrated Voice over LTE (VoLTE) and HD Voice capable user devices at Mobile World Congress 2011 and is one of several operators who are planning to deploy a commercial VoLTE service.

HD Voice phones: GSA’s database

GSA tracks vendor announcements about launched HSPA and HSPA+ user devices including phones. We developed a unique database and analysis tool called GAMBoD. One tool focuses on HSPA devices (GAMBoD-HSPA) and another on LTE devices (GAMBoD-LTE). HSPA devices supporting HD Voice (i.e. with W-AMR) are identified in the GAMBoD-HSPA tool. The GSA database, which is subject to updates, referenced 73 HD Voice mobile phones in early April 2012. Note that certain products may be carrier specific and may not be compatible for all networks or all markets. This information is provided for interest and guidance only.

Log in to GSA’s GAMBoD-HSPA tool to review the list and features of HD Voice-enabled HSPA phones.

Typically Mobile HD Voice services are only available to customers on the same national network, and where both the calling and called party each has an HD voice compatible mobile phone. Many operators are working towards agreements to enable mobile HD Voice calls to be handled across networks. Interoperability between fixed and mobile networks for handling HD voice calls is also a priority.

In order to offer “seamless” HD Voice for its customers, Orange has announced the major steps that the company is taking:

- In 2012/2013, HD Voice interoperability between Orange countries and also between the fixed and mobile networks in a given country.
- In 2013, interoperability between the various operators, based on common standards, such as CAT-IQ 2.0 for fixed HD Voice or WB-AMR for mobile HD Voice.
- Orange is looking into launching HD Voice on the 2G networks, which would make it possible to offer this service to even more customers.

However all IP networks operated by third party interoperability providers can help to facilitate new market opportunities by providing the required inter-network connectivity and interoperability for HD Voice services, both at national and international level. BT is one such provider and BT’s Global IP Exchange service provides the necessary seamless connection between service providers. A white paper “BT Global IP Exchange” (available to download in the Mobile HD Voice Zone on www.gsacom.com) explains how mobile network operators can benefit from the opportunity to deliver and charge for cross-network national and international and roaming HD calls.

About GSA:
GSA (the Global mobile Suppliers Association) represents GSM/EDGE, WCDMA-HSPA/HSPA+ and LTE suppliers, providing reports, facts, analysis and information explaining market developments and trends. The GSA website has approaching 50,000 registered users.

Information for this report was obtained wholly by GSA (Global mobile Suppliers Association – www.gsacom.com), referencing information exchanges with key contacts in mobile network operators, in GSA member organizations, with other industry specialists, and public announcements. Errors and omissions excepted.

Updates are welcome to info@gsacom.com
